FARM WAGE RATES UP, EMPLOYMENT DOWN

Wage rates paid to hired farm workers on January 1 continued their rise, the Bureau of Agricultural Economics reported today. They were up 3 percent from a year earlier. Farm employment was curtailed by unfavorable weather. There were 7,155,000 persons at work on farms during the week ended December 25, a third of a million less than a year earlier.

Farm wage rates on January 1, 1949 averaged 60 cents per hour when all cash rates were converted to per hour equivalents and weighted by the number of workers receiving each type of rate (see page 3). This was 2 cents per hour more than on January 1 a year ago and 2 cents less than on October 1. The decrease from October 1 was less than usual as shown by the 3 percent increase in the seasonally adjusted index of farm wage rates. The seasonally adjusted index indicates that while wage rates are still increasing as of the first of this year the rate of increase is less this year than it has been in the past few years. It appears likely that lower prices received by farmers and prospective lower net incomes are tending to limit increases in farm wage rates.

Comparisons by type of wage rates for this January with those for the previous year and the previous quarter show about the same pattern of change for each type. The level of wage rates was higher on January 1 than a year earlier and less than on October 1, 1948. The per week and per hour without board or room categories are exceptions where the October 1 rates were below January 1, 1949. The changes in both the per hour rates probably need some explanation. The October 1 per hour with house rate is high in comparison with January rates, mainly because payment at hourly rates is of greatest importance in the West during the harvest season while during the winter and spring months it is used in the South. The per hour rate without board or room shows an opposite trend. The October rate was lower than in January in either year. The lower rate in October was due to a very large proportion of workers employed at these rates in the South.

Weather during the week ended December 25 was very unfavorable for farm work. Heavy rains along the Atlantic Coast, which turned to snow from Maryland northward early in the week, limited field work in the area during the entire week except in Florida. Heavy snow also fell in the upper Mississippi Valley and eastward. By the end of the week the coldest weather of the season, which had moved into the West early in the week, had covered the entire country. Additional snow accompanied the movement of cold weather across the country.

Outdoor work was largely confined to the extreme southern sections of the country. Citrus and vegetable harvests continued in Florida, Texas, Arizona,

HD
1525
13

and California. Little progress was made in the South in harvesting the small amounts of corn, cotton, and peanuts still in fields. Over most of the country farmers were doing little more than necessary chores. In some cases odd jobs were being taken care of.

With unfavorable weather during the reporting week and especially good progress with fall harvest a 5 percent decrease in farm employment from a year ago is not surprising. An additional factor was the unusually pleasant weather during the survey week last year which held employment up. Both family and hired employment dropped below a year ago with a slightly larger percentage decline in hired employment. The percentage decrease in family employment was fairly evenly distributed by regions. However, the change in the number of hired workers was not consistent over all regions. There were more hired workers this year than a year earlier in New England and the Middle Atlantic States and about the same number in the South Atlantic States. The decreases were all in the Central and Western Regions. In these regions the decline ranged from 7 to 12 percent with the larger changes in the West where weather was most unfavorable.

The number of people working on farms decreased nearly 2 millions from late November to late December. The decrease in family workers amounted to a little more than a million and a quarter and that for hired workers to a little more than a half million. The seasonal decline in total employment was about 150,000 larger than a year earlier. The largest decreases this year occurred in the South where they ranged from 39 percent in the East South Central States to 23 percent in the South Atlantic and 22 percent in the West South Central States. The smallest decrease, 10 percent, was in the West North Central States. The number of family workers decreased most in the South Atlantic and East South Central States. Family employment was down a fourth in the South Atlantic States and a third in the East South Central Region. The number of hired workers was about 60 percent less than a month earlier in the East and West South Central Regions. Decreases in the number of family workers were smallest in the West while for hired workers the drop was least in the Middle and South Atlantic States.

REVISED FARM EMPLOYMENT AND WAGE RATE ESTIMATES

This issue of Farm Labor carries revised series of farm employment estimates and of farm wage rates. Revised definitions of farm employment and new benchmark data were used to establish the employment estimates. Changes in the wage rate series are due to the use of new wage rate categories and to the use of a somewhat different weighting method.

Farm employment. - Farm employment estimates have been issued by the Bureau of Agricultural Economics since 1936 as an extension of the series in "Trends in Employment in Agriculture 1909-36." ^{1/} Revisions in this series have now been made in line with improved definitions and basic data as planned by B.A.E. when extensive farm employment and wage surveys were undertaken in 1945. The new surveys also provided benchmark data for better measurement of seasonal change.

^{1/} Eldon E. Shaw and John A. Hopkins, WPA National Research Project, Report No. A-8.

Nation-wide interview surveys in March, May, and September 1945, July 1946, and January 1947 have furnished data on farm employment for various seasons. In addition, more precise definitions of farm employment have been used. The major changes from the old employment series include the counting of all farm operators doing any farm work instead of only those working 2 or more days; the change from the old indefinite 2 or more days work requirement for family workers and hired workers to the new 15 or more hours work for family workers and any paid work for hired workers; and the use of a specified week for counting employment rather than the indefinite "during the past week" wording used formerly. The new series covers employment on all farms whereas in the old series adjustments were made to exclude employment on some of the part-time farms. There are also some changes in level and changes in seasonal distribution due to the use of interview survey data which furnished information not previously available.

The revised series of employment estimates is presented only for the 1944 to 1948 period. Extension of the series to earlier dates will be presented later.

Wage rates.— The same four categories of wage rates have been carried since 1866. Hiring practices change over time and it is probable that changes have been accelerated in recent decades. Less than half of the hired farm workers employed in the harvest season are now paid the monthly and daily rates that made up the old series. It is no longer true that regular workers are hired only by the month and furnished a house or room and board and that seasonal workers are paid only at day rates either with or without room and meals. Hourly and daily rates are now often paid full-time regular workers who are furnished major perquisites. In the South, for instance, croppers are often hired as day hands and paid daily rates or hourly rates and also receive a house. Weekly rates for regular workers with and without perquisites are popular in the Northeast. On the Pacific Coast, operators of large enterprises sometimes furnish housing to seasonal workers, but generally pay all seasonal workers either hourly or piece work rates.

Under the new program, 9 different categories of wage rates are used. Only the most important types are estimated for each region and States within the region. The number by regions varies from 3 to 6. Wage rates, on the new basis, are presented for January 1, 1948 and 1949 and October 1, 1948. Two schedules were used last year, one with the new questions and one with the old, so that wage rates are available on both the new and old basis for 1948.

Weights used for combining State estimates into regional estimates and different categories of rates into a "composite" of all rates were obtained from interview survey data which showed the percentage of hired workers receiving each wage rate at different seasons. Factors to convert monthly, weekly, and daily rates to hourly equivalent rates were also obtained from interview survey data. These equivalent hourly rates are combined to obtain a weighted average of all rates which is called the "composite" rate. The composite is used to calculate the index of farm wage rates.

More detailed information on the sample, definitions, and methods of revision may be obtained from the Bureau of Agricultural Economics, U. S. Department of Agriculture, Washington 25, D. C.

DEFINITIONS AND EXPLANATIONS

Employment.- Farm employment estimates of the Bureau of Agricultural Economics cover persons doing farm work on all farms. Mailed questionnaires are received every month from 15,000 to 20,000 farmers who report the number of persons working on their farms. Interview surveys of farmers are used less frequently to provide benchmark data on employment. The survey week for the mailed questionnaire each month is the last complete calendar week in the month except when that week includes the last day of the month; in that case the survey week is the next to the last full calendar week.

Employment Concepts.- All farm operators are counted as employed if they spend 1 hour or more during the survey week at farm work, chores, or in the transaction of farm business. Members of the operator's family or household doing unpaid farm work, or chores, are counted if they put in 15 hours or more during the survey week. Operators plus unpaid members of their families or households who meet these criteria of employment are called family workers. All persons doing 1 or more hours of farm work or chores for pay during the survey week are counted as hired workers. Members of the operator's family doing farm work for cash wages are counted as hired workers. Croppers are considered family workers when working on their own crops, but hired workers when doing farm work for pay off their own tracts. If a person is employed both as a family worker and a hired worker during the week on the same farm he is counted as a hired worker.

Comparability with Other Data.- The data on farm employment published by the Bureau of Agricultural Economics differ from those on agricultural employment published by the Bureau of the Census in the Monthly Report on the Labor Force. The Bureau of Agricultural Economics collects information from the employer (the farmer) who reports the number of persons working on his farm during the week, regardless of the other jobs held by those workers. The Census data, on the other hand, are obtained through interviews with approximately 25,000 farm and nonfarm households with the housewife or some other member of the household reporting on the labor force status of the household members. They relate only to persons 14 years of age and over who are in the civilian population and not in institutions.

The difference between the BAE and the Census data is attributable mainly to the different treatment of three groups of workers. Children under 14 years of age who meet the criteria of employment are included in the BAE estimates, but not in the Census Bureau's. It is estimated that this number may reach a summer peak as high as two million. Persons working on more than one farm during the survey week are counted only once by the Census Bureau, but they are counted by the BAE on each farm where they work and meet the minimum hour requirements. This group is also more numerous during the harvest season when the demand for farm labor is greatest. The additional count of workers attributable to this duplication is estimated at a minimum of a quarter of a million and may be considerably larger. The third group is composed of persons who work in both agricultural and nonagricultural employment, but work longer at the nonagricultural job; they are classified by Census as working in

nonagricultural employment, but by the BAE as working on a farm. This last group may range from one-half million to a million in different seasons of the year.

Other groups counted by the BAE but not by the Census Bureau are imported foreign workers and some migratory workers not living in private households. On the other hand, the Census Bureau includes in its estimates of agricultural employment certain classes of workers which the BAE does not include. Persons with "non-farm" occupations who are working on farms, such as book keepers and typists, some persons in certain agricultural processing activities, and farm operators with no other job who did no farm work are considered as employed in agriculture by the Census Bureau, but are not included by the BAE in its estimates of agricultural employment.

Because the volume of agricultural employment is affected by changes both in season and in weather, the difference in the week of the month for which the data are collected may also make some difference. The BAE data relate to the last full calendar week ending at least 1 day before the end of the month while the Census Bureau information relates to the week containing the eighth of the month.

The BAE estimates farm employment from current reports made by a selected group of farmers adjusted to enumerative survey benchmark data. The Bureau of the Census bases its figures on a sample of dwelling units. Accordingly, the figures in both cases are subject to sampling variation and may differ from the results of a complete census.

Wage Rates.- Wage rates are reported quarterly by the same sample of farm operators that reports employment. The farmer is asked to report average wage rates being paid "at this time" in his locality. The "at this time" on the average probably represents the second or third day before the end of the month.
